

Artificial Intelligence Basics

What is AI?

Artificial Intelligence is the simulation of human intelligence by machines. It enables computers to learn from data, recognize patterns, and make decisions with minimal human intervention.

Machine Learning

Machine Learning is a subset of AI where systems learn from data automatically. Instead of being explicitly programmed, ML models improve through experience. Common types include supervised learning, unsupervised learning, and reinforcement learning.

Deep Learning

Deep Learning uses neural networks with many layers to model complex patterns in data. It powers modern applications like image recognition, speech processing, and natural language understanding.

Applications of AI

AI is used in healthcare for disease diagnosis, in finance for fraud detection, in retail for recommendation systems, and in transportation for self-driving vehicles. The technology is expanding rapidly across all industries.
